Aim - To implement Non-Restoring division algorithm using c-programming.

Objective -

- To understand the working of Non-Restoring division algorithm.
- To understand how to implement Non-Restoring division algorithm using c-programming.

Theory:

In each cycle content of the register, A is first shifted and then the divisor is added or subtracted with the content of register A depending upon the sign of A. In this, there is no need of restoring, but if the remainder is negative then there is a need of restoring the remainder. This is the faster algorithm of division.

Conclusion -

This experiment and code implementation of the Non-Restoring Division Algorithm have provided valuable insights into the world of binary division. We have demonstrated the

algorithm's effectiveness in dividing binary numbers without the need for restoring operations, making it suitable for hardware implementations where efficiency is critical. This experiment has not only showcased the power of algorithmic optimization in digital computation but has also illustrated the practical application of non-restoring division as a reliable method for achieving precise binary division in a hardware context.
